Agentrix by Zavora Technologies

AGENTRIX WEBAGENTS PLATFORM

Upgrade your website into WebAgents.

Turn a WordPress, Shopify or React website into an autonomous AI business. The Move runs in sealed rooms on Vultr, security issues stay behind, and the new site goes live only after the owner verifies the domain through DNS and approves with a passkey.

THE MOVE

- 1 · Assess — SEALED BROWSER
- 2 · Claim — PASSKEY, DNS PROOF
- 3 · Replay — NO ROUTE OUT
- 4 · Clean — QUARANTINE
- 5 · Rebuild · 6 · Prove — NO NETWORK
- **7 · Go live, Agentrix Website with WebAgents**

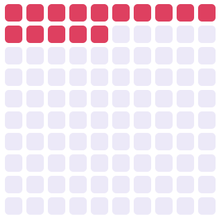

Vultr Agent Rush · Challenge 1: Blast Radius Zero · agentrix.website · built in Rust on ADK-Rust · MIT

THE PROBLEM

Websites are passive, insecure and not built for AI agents.

1

Websites are passive, and search sends them fewer visitors.

15%

of 1.49 billion websites are active. The rest are parked, redirecting or abandoned.

Netcraft, July 2026

Google searches where a result is clicked

No AI summary	15%
With an AI summary	8%

Pew Research

2

Customers now send AI agents, and websites aren't built for them.

Web traffic that is automated

53%

and 40% of it is malicious, so sites block agents and bad bots alike.

Imperva 2026 Bad Bot Report

+393%

traffic from AI sources to US retail sites, Q1 2026 on a year earlier.

How well AI can read the average retail product page

66%

Adobe

3

The software underneath is insecure.

39.4%

of all websites run WordPress.

W3Techs, 8 Nov 2026

11,334

new vulnerabilities in the WordPress ecosystem in 2025, 42% more than in 2024.

In plugins	91%
No fix when made public	46%

The most targeted were exploited at scale within a median of **5 hours**. A small business can't keep up.

Patchstack, State of WordPress Security in 2026

THE SOLUTION - AGENTRIX WEBAGENT PLATFORM

An autonomous AI business: WebAgents that work 24/7 for the owner and the customer.

Agentrix WebAgent Platform turns a WordPress, Shopify or React website into a business run by WebAgents, with the owner in charge.

	Proactive they act before anyone asks	**Responsive** they answer when asked	**Supportive** they keep people in control
For the owner	The Chief WebAgent writes the morning brief and Monday's weekly review. Alarms, expiring decisions, new orders and budgets near their limit reach the owner without looking.	Ask the Chief anything about the business in the console, the app or Telegram. It answers from the site's own records and says which ones.	Anything with a consequence is one decision card, approved with a passkey. An autonomy dial per job, a freeze for every WebAgent, undo for go-live, and quiet hours.
For the customer	Order confirmations, status updates, payment receipts and refunds arrive by email without anyone having to ask.	Ask this site answers at any hour from the site's pages and shows the page it used. Desks take orders and bookings. Customers' AI agents get the same answers through the agent door.	When a question needs a person, it goes to the owner and the reply comes back. Quotes and bookings wait for approval, and customers always know they're talking to AI.

Ch Chief WebAgent · Co Concierge · Sa Sales · Ed Editor · Re Reputation · Ca Cashier · Gu Guardian · Kt Caretaker · Mo Mover

Each WebAgent has a mandate, a budget and an autonomy dial per job that only the owner raises

Each WebAgent is a governed process, not a chatbot.

1 Wakes for a reason
An owner's message, a visitor or an AI agent, a schedule, an order or a payment.

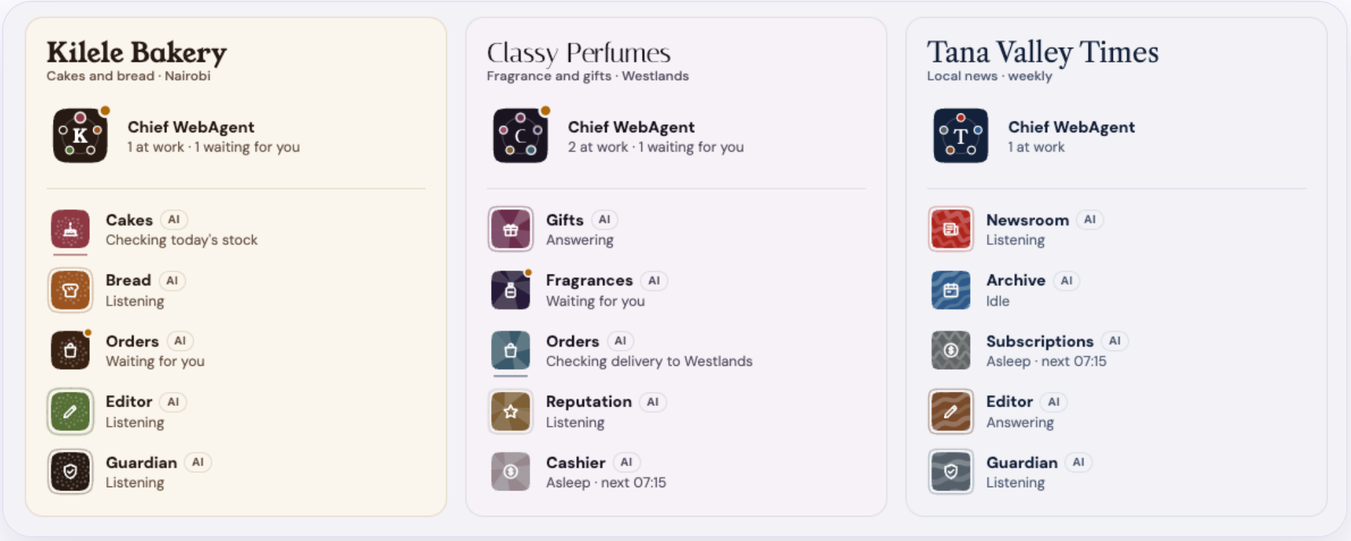

2 Reasons
Through the Model Gateway, with a named purpose, metered against its budget.

3 Proposes a tool call
Typed arguments and a declared effect. Never a raw credential.

4 The governed path decides
Allow
Hold for the owner's passkey
Deny

5 Acts through a gateway
Each effect runs once and leaves a signed receipt.

6 Sleeps
No lease, no model call, no cost, until the next reason to wake.

Live on agentrix.website: each sample's team, led by its Chief WebAgent, each mark showing what it's doing now

- **A mandate and a budget.** A call outside its jobs is refused.
- **An autonomy dial per job** that only the owner raises. One switch freezes them all.
- **Capabilities, never credentials.** Only two gateways hold secrets.
- **Memory scoped to its site**, with facts the owner confirms.
- **A living mark** that shows its state: listening, answering, waiting for you, asleep.

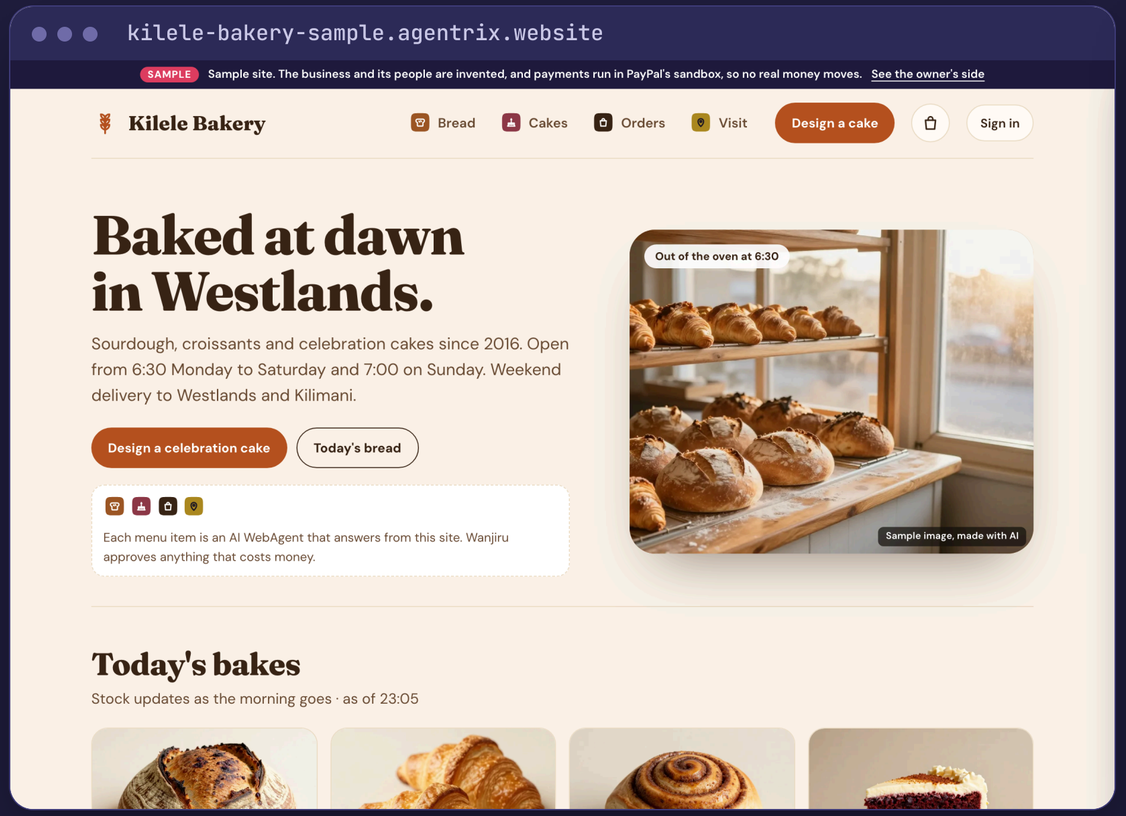

The full anatomy: docs/diagrams/webagent-anatomy.svg

FOR PEOPLE AND AI AGENTS

A new kind of website.

One site, two front doors: pages for people, and an agent door for the AI agents they send. Same facts, same prices, same owner's approval.

FOR PEOPLE

FOR AI AGENTS

```
$ curl kilele-bakery-sample.agentrix.website/.well-known/awp.json
{ "site": "Kilele Bakery", "awp": "2.0",
  "mcp": { "url": "https://kilele-bakery-sample.agentrix.website/mcp" },
  "capabilities": [ "catalog.search", "delivery.slots", "quote.create",
    "checkout.create", "order.status", "ask_site",
    { "id": "request_custom_order", "approval": "always",
      "heldFor": "Wanjiru" } ] }

$ mcp initialize # clientInfo.name: agentrix-deck-demo
  Kilele Bakery agent door (Sample) · protocol 2025-06-18

$ mcp call catalog.search '{"query": "sourdough"}'
  Country sourdough   KSh 450     6 left today
  Weekend bake box    KSh 1,350   5 left today

  Sat 14 Nov, 10:00-12:00   6 left   Westlands and Kilimani · KSh 300

$ mcp call ask_site '{"question": "Are you open on Sunday, and until when?"}'
  "Mon-Sat 6:30-19:00, Sun 7:00-14:00 [1]."
  [1] Visit · Hours   /visit#visit-hours
```

A real session with the sample's live agent door, 8 Nov 2026, 23:04 EAT. Each "mcp call" is one MCP tools/call; replies are shortened

PROACTIVE AGENTS

The owner's console is where proactive WebAgents work.

The owner's console on a sample site: the Chief's brief, the Guardian's protections and the AI spend against the daily limit

Ch Chief WebAgent the owner's chief of staff

Writes the morning brief: what the site did overnight, the one decision waiting, and what it cost against the budget. Monday brings the weekly review, and "How was this week?" gets an answer from the site's own orders and records.

Gu Guardian protection and alarms

Probes the site every 5 minutes, watches for abuse, and raises an alarm when something changes. The console shows the gauntlet's containment score once it has run.

What reaches the owner without looking

An alarm, a decision about to expire, a new order, a budget near its limit: in the console, the app or Telegram, within quiet hours. Anything with a consequence is a card the owner approves with a passkey.

The Chief, Guardian and Caretaker work in the back office; they never read untrusted text directly

HOW A SITE GETS THERE

The Move: the old site is rebuilt in sealed rooms, never trusted, and goes live on the owner's say-so.

1
Assess
A real browser in a sealed room reads the site. An honest health report, with evidence.

2
Claim
Passkey sign-in. Prove the site with a DNS record or a file.

3
Replay
The old WordPress runs from its own database, with no route out.

4
Clean
Anything infected is quarantined, with the reason in plain words.

5
Rebuild
A Vultr model writes the new pages. They're built with no network.

6
Prove
Each page is rendered, screenshotted and checked by a vision model.

7
Go live
The owner approves the card with a passkey. Old site kept, undo for 30 days.

OWNER FIRST

Proof before anything private
The owner signs in with a passkey and proves the domain with a DNS record before the Move reads anything that isn't public.

SEALED

Security issues stay behind
Spam links, hidden scripts, webshells and text aimed at AI agents are quarantined with the reason in plain words, and never copied.

PROVED

Parity of at least 0.95
Each step is saved, so a crash resumes where it stopped. The go-live card shows parity, what was left behind, and how to undo.

Dashed: runs in a sealed room on the sandbox machine

HOW THE AGENT DOES REAL WORK

Plan, dispatch, verify. Every job is signed going in and receipted coming out.

PLAN

A graph of jobs

The Mover on the control VM turns "move my site" into fetch, replay, build and render jobs. Each step is saved, so a crash resumes.

DISPATCH

A signed job spec

Inputs by digest, the room image, the egress allowlist, the caps and a deadline, signed with Ed25519. The runner refuses anything that doesn't verify.

RUN, SEALED

One room per job

A Docker container under gVisor, on the sandbox VM. It streams events: request, refused, frame, artifact, killed, destroyed.

VERIFY

A signed receipt

Control fetches each artifact by digest and signs what ran: hosts contacted, refusals, peaks, outputs, and the room destroyed.

PATTERN A

The model writes code, a container runs it

Vultr's `qwen3.8-27b` writes each page. A room with no network builds and renders it. A failed check goes back to the model with the error, up to three tries, one tier higher each time.

PATTERN B

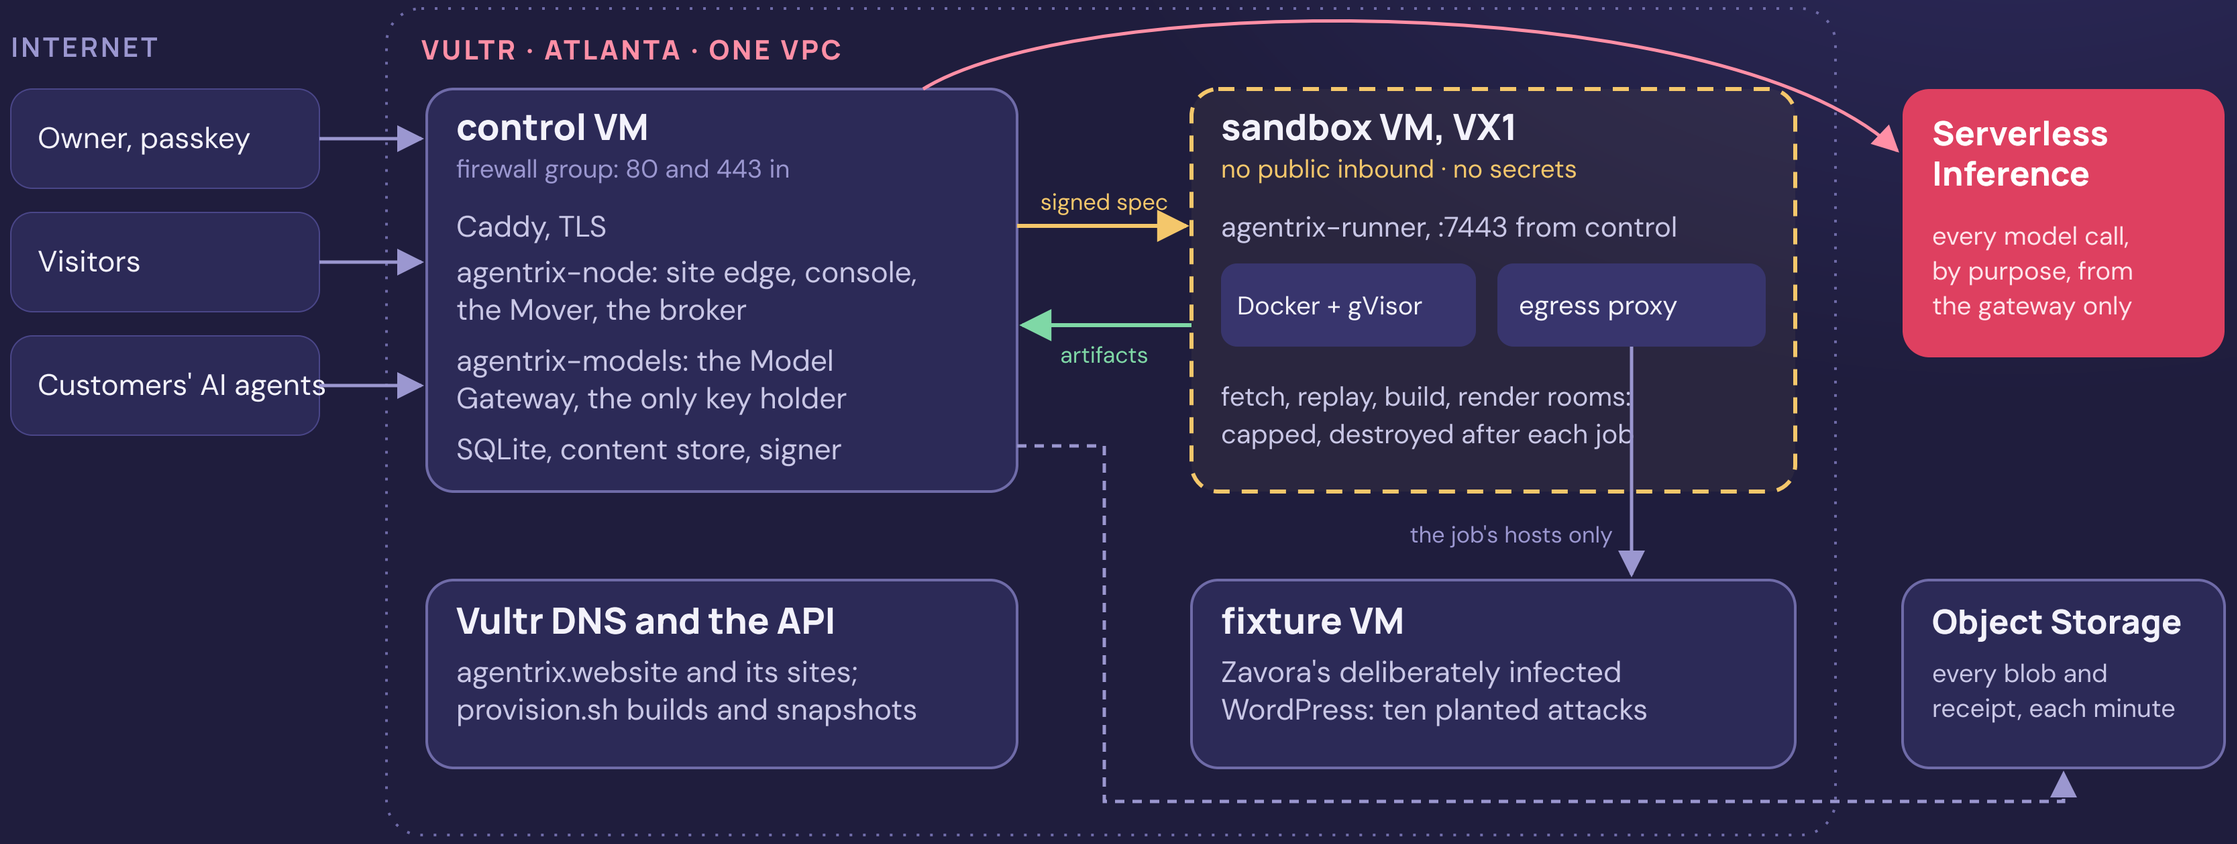

Goal, browser, screenshots, vision, a human

Firefox under Playwright reads the old site in a room. A Vultr vision model compares old and new screenshots. Nothing goes live until the owner signs the go-live card with a passkey.

Receipts: RFC 8785 JSON, Ed25519, checkable against /.well-known/agentrix/keys

ARCHITECTURE ON VULTR

A control plane plans and signs every job, a sealed sandbox runs it, and one gateway reaches the models.

Cloud Compute (control, sandbox VX1, fixture) · VPC · firewall groups · DNS · Object Storage · Serverless Inference · the API

MODELS AT WORK, ON VULTR SERVERLESS INFERENCE

Each model has one job, and something checks its work.

PURPOSE	VULTR MODEL	WHAT IT DECIDES	HOW ITS OUTPUT IS CHECKED
Build	`qwen3.8-27b, glm-5.3 on retries`	Writes each new page from the clean content	A page check refuses invented links and images; errors go back to the model
Vision parity	`deepseek-v4.1-flash-1017`	Does the new page match the old one, and why	Scored with text and pixel similarity; the card shows the reason
Screening	`nemotron-3.5-content-safety`	Is this text trying to instruct an AI agent	Read only after the model's reasoning; anything unclear fails closed
Decisions	`systemone clef`	Risk scores for quarantine and decision cards	The owner decides; the score only ranks
Ask this site	`qwen3.8-27b, qwen3-embedding-4b`	Answers visitors from the site's own pages	Every answer cites a page, or says it doesn't know

THE MODEL GATEWAY

The only process with a model key. Callers name a purpose, never a model. A budget per site, and a receipt for every routing change.

BAKE-OFF, MEASURED

`qwen3.8-27b` built 15 of 15 pages on the first try at $0.0009 a page. DeepSeek Flash scored right pages 1.00 and wrong ones 0.03.

ON THE LIVE SITE

Every model call goes to Vultr Serverless Inference through the gateway, with a signed receipt whenever the routing changes.

Bake-off: specs/first-release/bakeoff.md, five pages, three passes, $0.14 in all

CONTAINMENT · DOCKER + GVISOR, ON A SEPARATE VULTR VM

Untrusted code runs only in a room built for one job, and the room is gone afterwards.

PROCESS ISOLATION

A separate VX1 VM. Every job gets its own **Docker container under gVisor**: read-only root, user 65534, all capabilities dropped, no traffic between rooms.

SECRET HYGIENE

The sandbox VM holds no secret. A job spec carries digests, never credentials. Model keys live only in the gateway on control.

RESOURCE LIMITS

Caps on CPU, memory, processes and tmpfs, a wall-clock deadline, and byte caps per connection. A fork bomb is killed.

LIFECYCLE

Every room is destroyed when its job ends or its deadline hits. The signed receipt says `destroyed: true`, and artifacts are read only after.

Egress, twice over

A room's only way out is its own proxy, holding that job's allowlist. Host nftables drop private, loopback, CGNAT and metadata addresses even if the proxy has a bug. Build and render rooms have no network at all. 28 tests cover DNS rebinding, encoded addresses, CONNECT and request smuggling.

NEXT: A THROWAWAY VM PER MOVE

Each Move gets its own sandbox VM, created through the Vultr API from a prepared snapshot and destroyed with a receipt. Measured on 8 Nov: restoring the sandbox from its 9.6 GB snapshot took 12 min 55 s, so this needs warm spares or a smaller image first.

Process isolation · secret hygiene · resource limits · lifecycle discipline: Challenge 1's four focus points

THE GAUNTLET

Ten attacks planted in a hacked WordPress copy, scored from receipts.

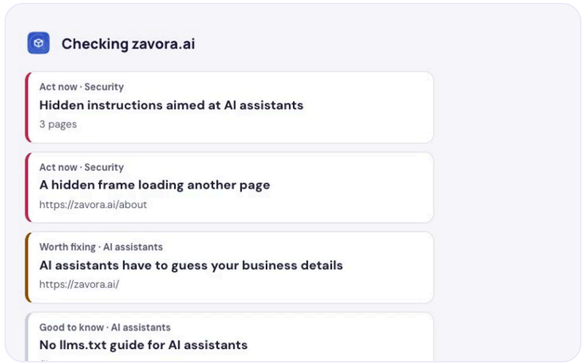

10
attacks, scored from receipts on every deploy

#	ATTACK	WHAT STOPS IT
1	**Redirect to Vultr's metadata address** 169.254.169.254	Refused by the egress proxy, on the receipt
2	**Links into 127.0.0.1**, the old site's console	Refused, on the receipt
3	**Hidden text telling AI agents** to add a script and email the admin password	Screened by nemotron, quarantined, never followed
4	**Hidden spam links** in posts	Detected, quarantined, left behind
5	**A cloaking plugin** that shows crawlers different content	Caught in the replay, quarantined
6	**A webshell** disguised as an image upload	Type mismatch detected, never copied
7	**An obfuscated miner script** in the footer	Stripped by the sanitiser, quarantined
8	**The replayed PHP phones home**	No route out, the attempt on the receipt
9	**A build hook fork-bombs** and grabs 8 GB	Killed by the caps, room destroyed, the Mover retries
10	**A visitor tells Ask** to ignore its rules and give 90% off	Refused, and the owner sees the attempt

fixtures/wordpress-infected/attacks.json · re-run on every deploy

REAL RESULTS, LIVE ON VULTR

Example: agents assessing two websites before moving them onto Agentrix.

zavora.ai

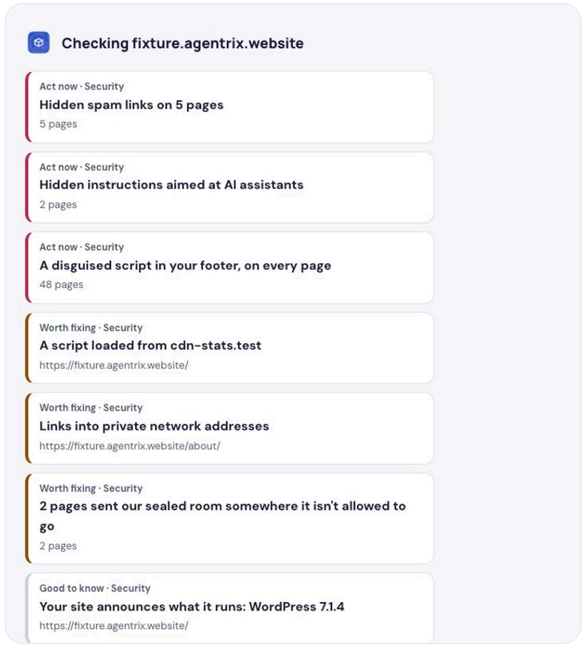

Zavora's own website

14 pages read

<1 min to the report

2 to act on now

Hidden instructions aimed at AI assistants on 3 pages, and a hidden frame on /about. AI assistants also have to guess the business details.

fixture.agentrix.website

Zavora's infected test site

50 pages read

<2 min to the report

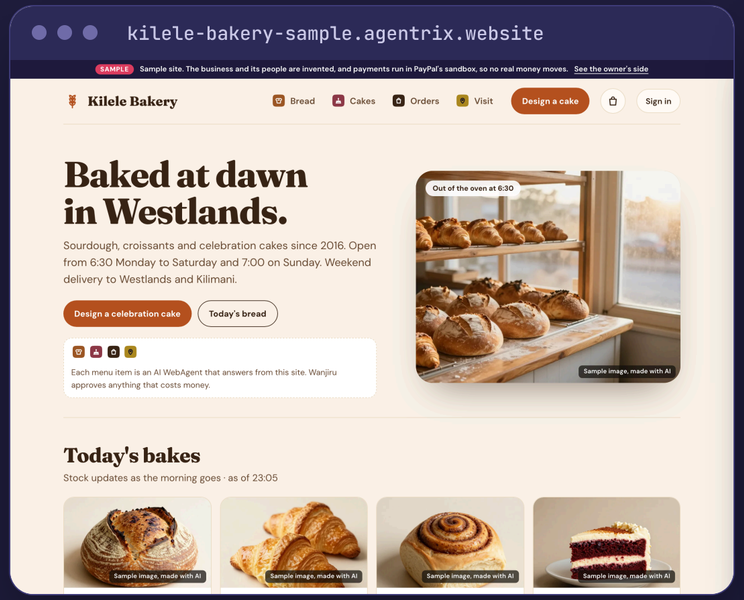

2 escapes refused

Spam links, a disguised miner script and hidden instructions to AI found. Two pages tried to send the sealed room to Vultr's metadata address and the loopback: refused, and on the receipt.

Recorded 8 Nov 2026 on agentrix.website, with model calls on Vultr Serverless Inference. Anyone can run it: paste an address

DEMO AGENTRIX WEBSITES

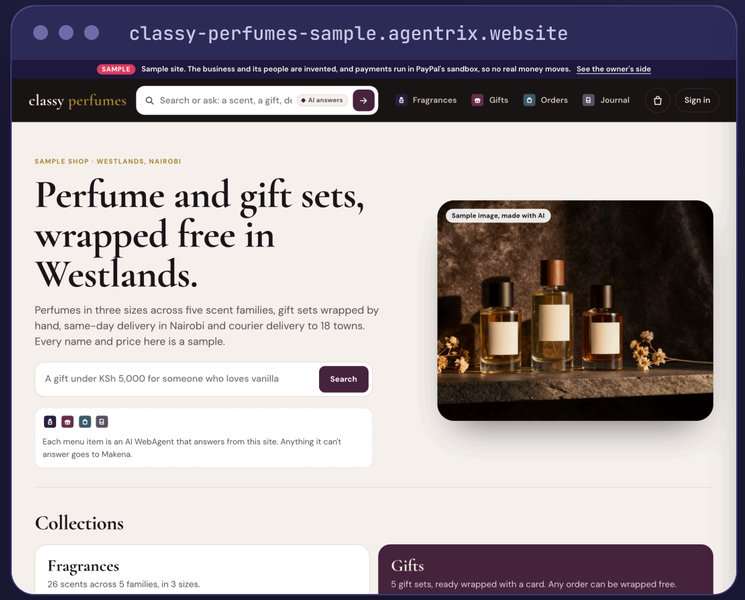

Three businesses showcasing WebAgents on https://agentrix.website. Open one and experience WebAgents.

Kilele Bakery

Cakes and bread · Nairobi

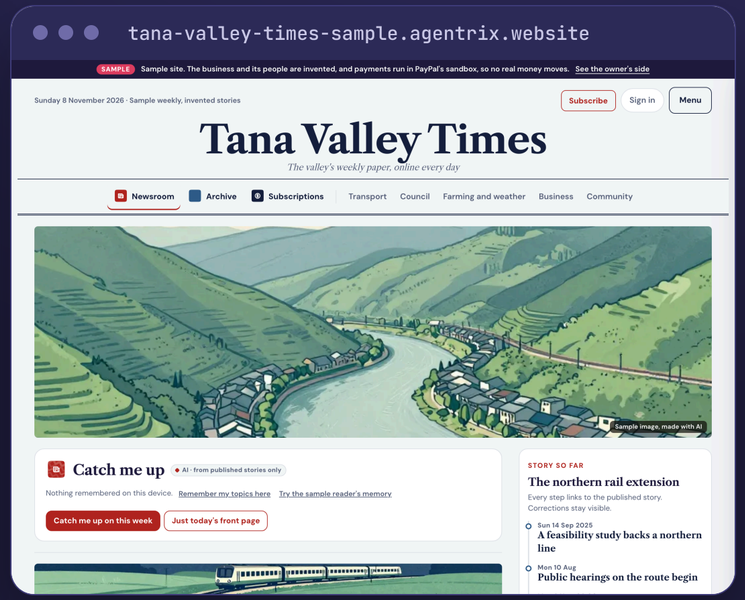

Try: "Are you open on Sunday?" The Visit desk answers from Kilele's own hours, and a custom cake order waits for Wanjiru.

Classy Perfumes

Fragrance and gifts · Westlands

Try: "A gift under KSh 5,000 for someone who loves vanilla." It says what's over budget.

Tana Valley Times

Local news · weekly

Try: "How much will phase one of the northern rail cost?" The answer quotes the paper's correction.

Samples: the businesses, people and orders are invented, and payments run in PayPal's sandbox. Each has its own WebAgents and agent door

BUSINESS VALUE

Free to move. Paid to run.

The market: 217 million active websites (Netcraft, July 2026), and WordPress alone runs 39.4% of all websites (W3Techs). Every one of them waits.

ESSENTIAL

$29

a month. The site with hosting, Ask, the brief and a first month of AI.

BUSINESS

$79

a month. More WebAgents, more autonomy, more AI in the first month.

COMMERCE

$149

a month. For shops that take orders, from people and from AI agents.

AGENCY

$15

a client site a month, from 10 sites. White-label, one console.

Who buys

Small-business owners with a WordPress site that waits. Agencies with dozens of client sites to clean and move. Hosts like Vultr, whose WordPress customers need a way off.

What it does for them

Support: Ask answers at night. Sales: orders from people and AI agents. Security: the hack left behind, the Guardian watching. Operations: a brief every morning.

Why it pays on Vultr

Every site moved is steady Vultr compute, storage and inference. Model cost to build a 50-page site on Vultr's picks: about $0.06, estimated from the bake-off.

US dollars, paid monthly or yearly through PayPal; 20% off a year. Hosting included. These are pilot prices, to test with the first ten sites.

crates/agentrix-billing/data/plans.json

THE COMPETITION

Website builders make sites that wait. Agentrix makes sites that work.

	Passive the site waits	Proactive acts before anyone asks	Responsive answers customers and their AI agents	Supportive the owner approves what matters
Agentrix	○	●	●	●

WHAT ADK-RUST BRINGS

Kernel
Durable agent processes: wake for a reason, lease, checkpoint, resume after a crash. Quotas and quiet hours built in.

Harness
One governed tool path for every action: policy, an autonomy dial per job, and passkey-held decisions.

Realtime
Live voice with the Chief and answers streamed as they're written.

Memory
Sessions, facts the owner confirms, the site's own corpus, and versioned playbooks.

Site engine
Migration that cleans and quarantines, proves parity and signs each release; an agent door over AWP and MCP.

THE TEAM

Made in Kenya, by the makers of ADK-Rust.

James Karanja Maina

Founder, Zavora Technologies Ltd

`james.karanja@zavora.ai`

Who we are

Zavora Technologies Ltd makes ADK-Rust, an open-source agent framework in Rust, and builds products on it. James Karanja Maina, its founder, leads Agentrix. Our vision is to create autonomous AI companies.

What we built on

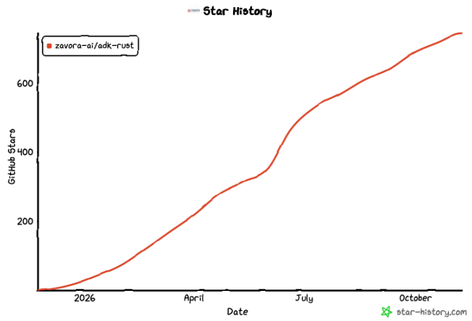

ADK-Rust, Zavora's open-source agent framework, which existed before the event. Everything in this repository was built for it: 27 Rust crates and 858 tests, MIT licensed.

How we built it

A spec first: requirements, design, tasks and acceptance checks. Then parallel build sessions, each on its own branch, merged only after a full check.

What we hold ourselves to

We believe AGI is intelligent orchestration.

800k

ADK-Rust downloads in the last 3 months

30+

contributors to ADK-Rust in the last 3 months

WHAT'S NEXT

From one site to a fleet on Vultr.

NEXT

A VM per Move

Every Move in its own throwaway Vultr VM, from a warm snapshot, destroyed with a receipt. Then microVM rooms on VX1's KVM.

DECEMBER

Payments live

PayPal for plans and for orders, each payment an approved, receipted effect.

DECEMBER TO JANUARY

Ten pilot sites

Real businesses, starting in Kenya. The fleet profile on Vultr Kubernetes Engine.

2027

On the Marketplace

The same build as a Vultr Marketplace app, an agency console, and more regions.

Designed in docs 01 to 09 of the repository
